## 1 Effective Calculability and Computability

## 2 Primitive Recursive Functions

### 2.1 Functions

For this paper,  $\mathbb{N}$  refers to the set  $\{0, 1, 2, 3, \dots\}$

## 3 The Ackermann Function

**Definition** (The Ackermann Function). *Let  $n, m \in \mathbb{N}$ . Then define  $A(n, m)$  as follows:*

$$A(m, n) = \begin{cases} n + 1 & m = 0 \\ A(m - 1, 1) & m > 0 \wedge n = 0 \\ A(m - 1, A(m, n - 1)) & m > 0 \wedge n > 0 \end{cases}$$

**Lemma 1.** *For any  $m, n \in \mathbb{N}$ ,  $A(m, n) \in \mathbb{N}$*

*Proof.* Proof Here

□

**Theorem 1.**  *$A(m, n)$  is a total function*

*Proof.* We will proceed inductively to show that  $A(m, n)$  is defined for all  $m, n \in \mathbb{N}$ .

Clearly  $A(0, n)$  is defined for all  $n \in \mathbb{N}$ . Assume  $A(k, n)$  is defined for some

$k \in \mathbb{N}$  and every  $n \in \mathbb{N}$ . Since  $k + 1 > 0$ ,  $A(k + 1, 0) = A(k, 1)$ , which is defined.

Now we assume  $A(k + 1, j)$  is defined for some  $j \in \mathbb{N}$ . By Lemma 1,  $A(k + 1, j) = a$  for some  $a \in \mathbb{N}$ . Then since  $j + 1 > 0$ ,  $A(k + 1, j + 1) = A(k, A(k + 1, j)) = A(k, a)$ . Since  $A(k, n)$  is defined for every  $n \in \mathbb{N}$  by our inductive hypothesis,  $A(k, a) = A(k + 1, j + 1)$  is defined.  $\square$

**Definition.** Let  $P$  be the set of all primitive recursive functions so that if  $f(x_1, x_2, \dots, x_n) \in P$  and  $m = \max\{x_1, x_2, \dots, x_n\}$ , then there exists  $t \in \mathbb{N}$  so that  $f(x_1, x_2, \dots, x_n) < A(t, m)$

**Theorem 2.**  $c(x), s(x), p_i(x_1, x_2, \dots, x_n) \in P$

*Proof.*

$$\begin{aligned} c(x) &= 0 < x + 1 = A(0, x) \\ s(x) &= x + 1 < x + 2 = A(1, x) \\ p_i(x_1, x_2, \dots, x_n) &= x_i \leq m < m + 1 = A(0, m) \end{aligned}$$

To verify  $x + 2 = A(1, x)$ , we proceed by induction.

$A(1, 0) = A(1 - 1, 1) = A(0, 1) = 2 = 0 + 2$ . Now assume  $A(1, k) = k + 2$  for some  $k \in \mathbb{N}$ . Then  $A(1, k + 1) = A(1 - 1, A(1, k + 1 - 1)) = A(0, A(1, k)) = A(0, k + 2) = k + 3 = (k + 1) + 2$ .  $\square$

**Theorem 3.**  $P$  is closed under composition

*Proof.* Let  $f, g_1, g_2, \dots, g_n \in P$ , where  $f$  is  $n$ -ary and each  $g_i$  is  $m$ -ary. Then  $f(g_1(x_1, \dots, x_m))$   $\square$

**Theorem 4.**  $P$  is closed under primitive recursion

*Proof.*  $\square$

**Theorem 5.**  $P$  is precisely the primitive recursive functions

*Proof.*  $\square$

**Theorem 6.**  $A(m, n)$  is not a primitive recursive function

*Proof.* Proof Here  $\square$

## 4 General Recursive Functions

### 4.1 Partial Functions

### 4.2 Definition of General Recursive Functions
